Quiz Questions

- Q1: main differences between LL and LR parse table?
LL: row – nonterminal, column – terminal + \$, cell – rule or empty
LR: action + goto, row – state, column – T+\$/N, cell – action/state
- Q2: for a sentential form $bbAa: S \Rightarrow_{rm}^* bBa \Rightarrow bbAa$, suppose bA is the handle, list the viable prefix.
b, bb, bbA
- Q3: for the grammar, get $FIRST(S)$ and $FOLLOW(A)$.
 $FIRST(S) = \{a, b\}$, $FOLLOW(A) = \{b\}$
- Q4: is the grammar a LL(1)?
NO. $FIRST(AB) \cap FIRST(a) \neq \emptyset$.
- Q5: augment the grammar, and give the initial state (S_0).
 $\{S' \rightarrow .S, S \rightarrow .AB, S \rightarrow .a, A \rightarrow .a, A \rightarrow .\}$

$S \rightarrow AB \mid a$
 $A \rightarrow a \mid \epsilon$
 $B \rightarrow b$

Example

(0) $S' \rightarrow S$ (1) $S \rightarrow BB$ (2) $B \rightarrow aB$ (3) $B \rightarrow b$

- **Closure:** the action of adding equivalent items to a set
 - Example: $S' \rightarrow \cdot S$ $S \rightarrow \cdot BB$ $B \rightarrow \cdot aB$ $B \rightarrow \cdot b$
- Intuitively, $A \rightarrow \alpha \cdot B \beta$ means that we might next see a substring derivable from $B\beta$ ($_{sub}$) as input. The $_{sub}$ will have a prefix derivable from B by applying one of the B -productions [期待意义等价]
 - Thus, we add items for all the B -productions, i.e., if $B \rightarrow \gamma$ is a production, we add $B \rightarrow \cdot \gamma$ in the closure

Example

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

$I_0:$

$S' \rightarrow \cdot S$

Example

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

I_0 :

$S' \rightarrow \cdot S$

$S \rightarrow \cdot BB$

Example

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

I_0 :

$S' \rightarrow \cdot S$

$S \rightarrow \cdot BB$

$B \rightarrow \cdot aB$

$B \rightarrow \cdot b$

Example

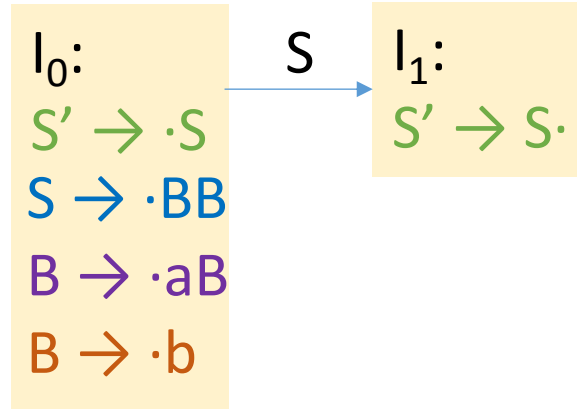

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

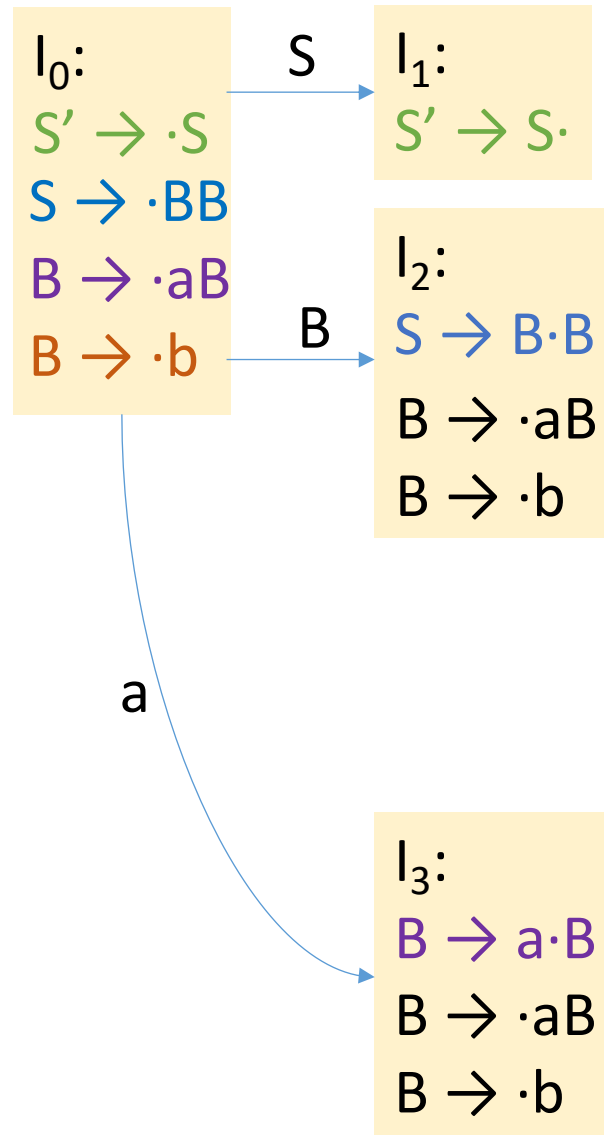

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

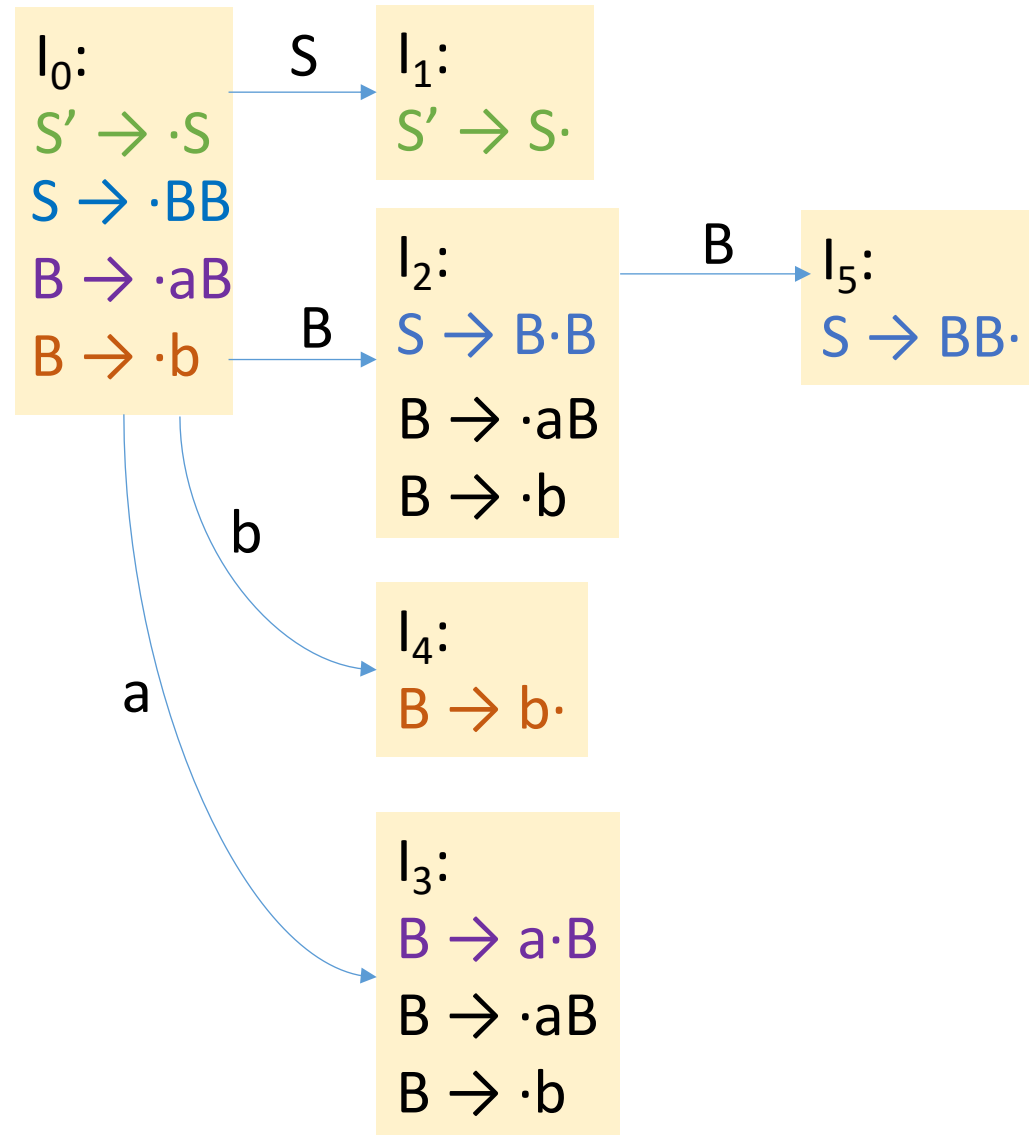

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

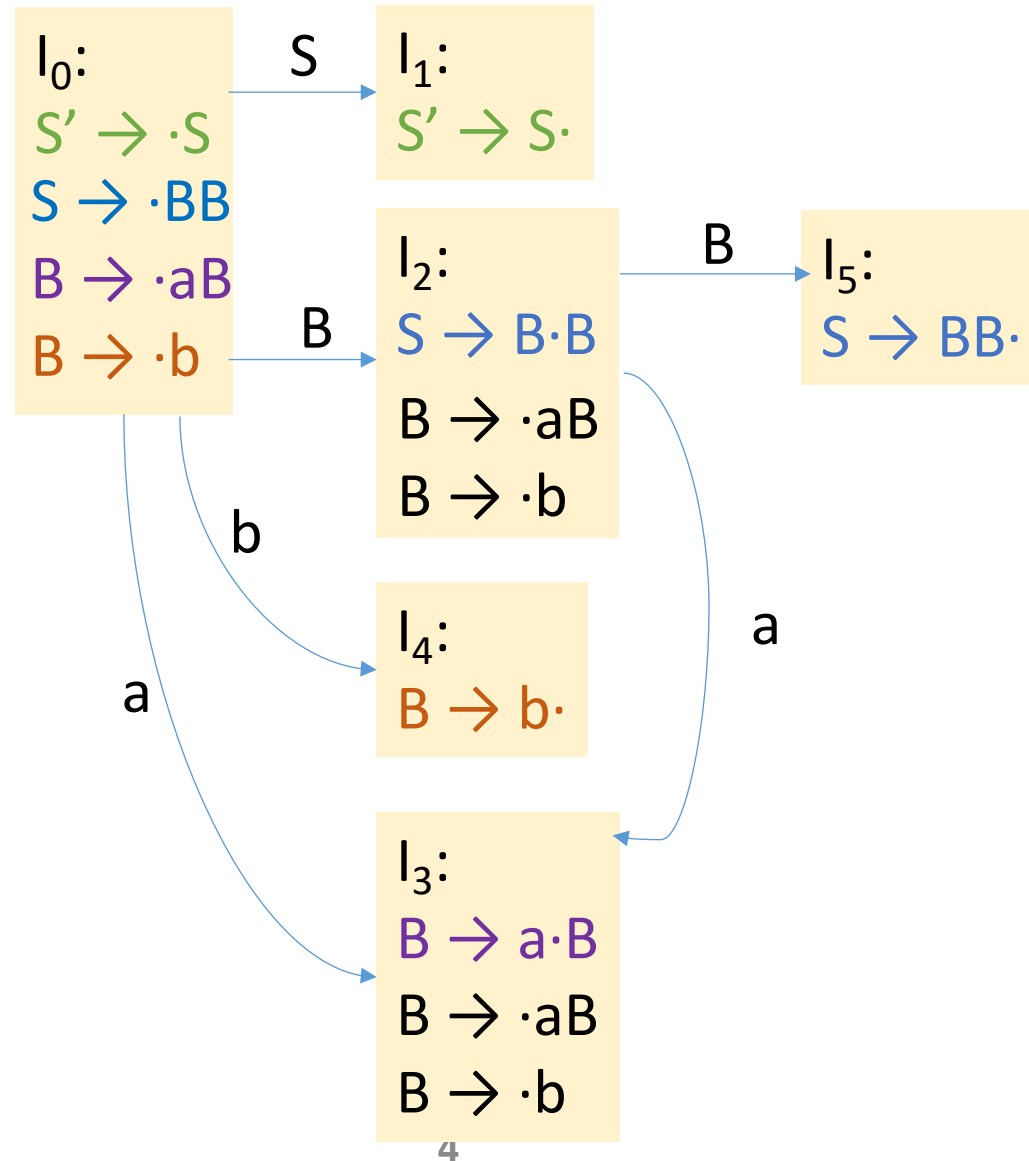

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

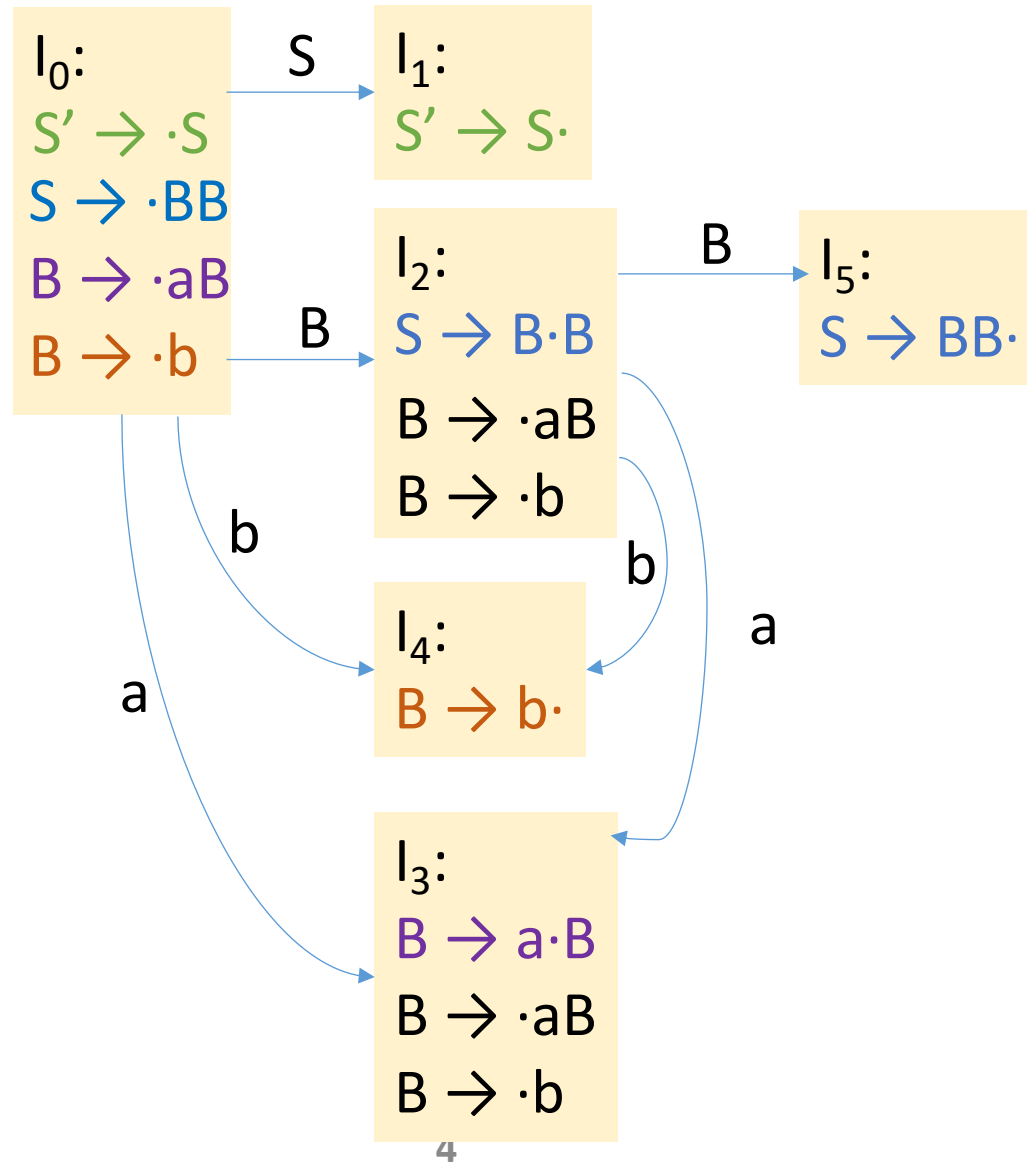

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

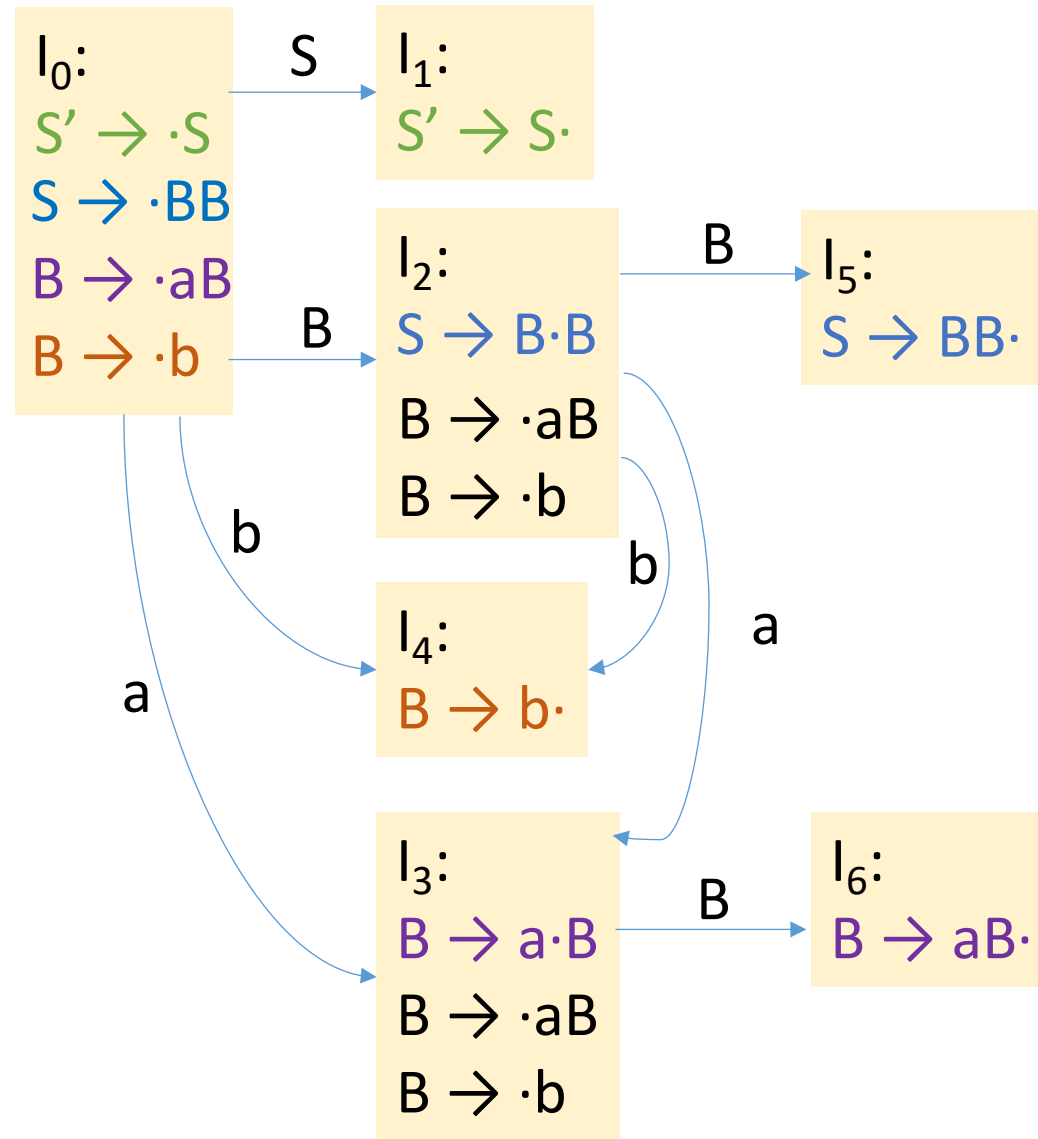

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

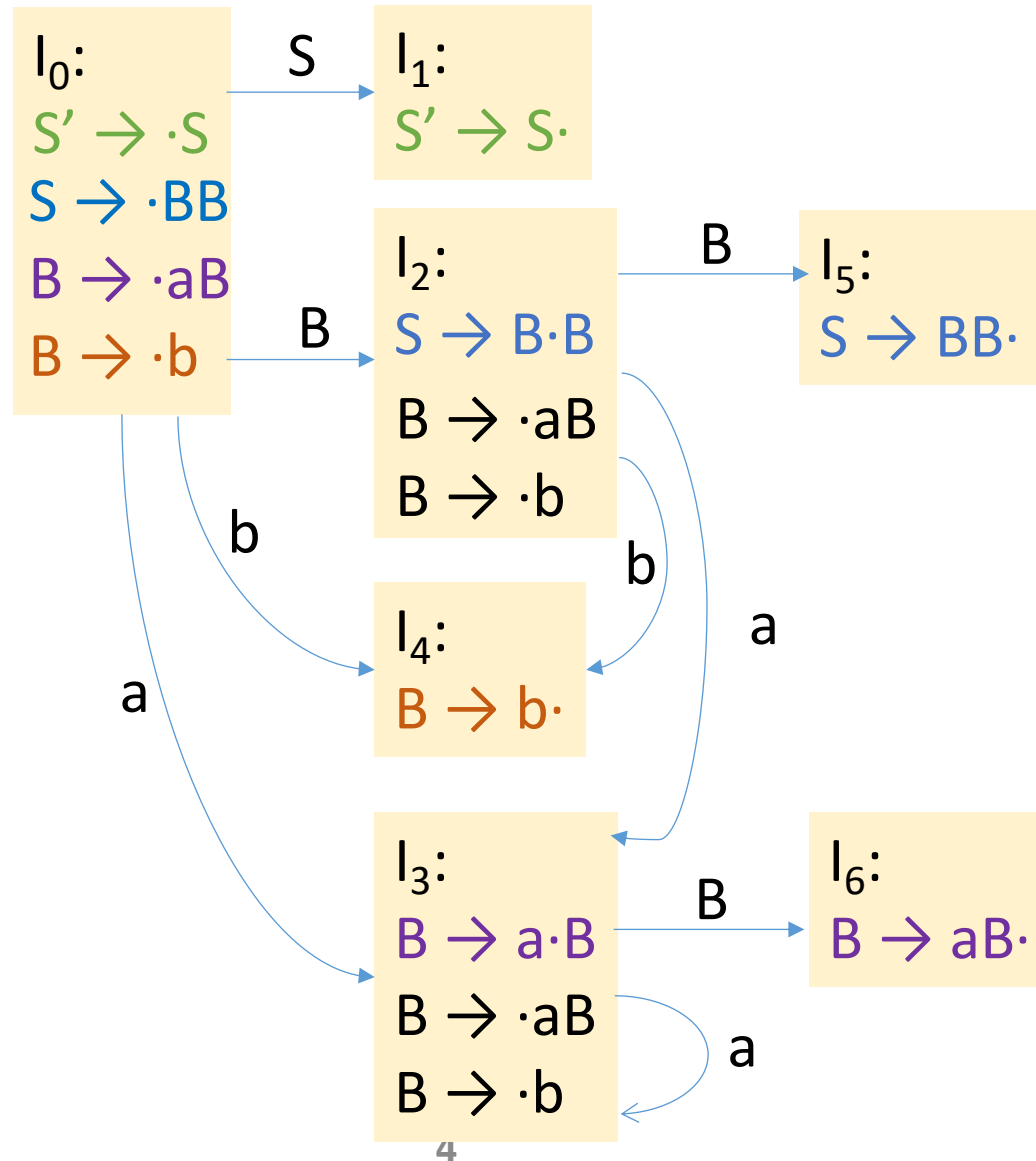

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

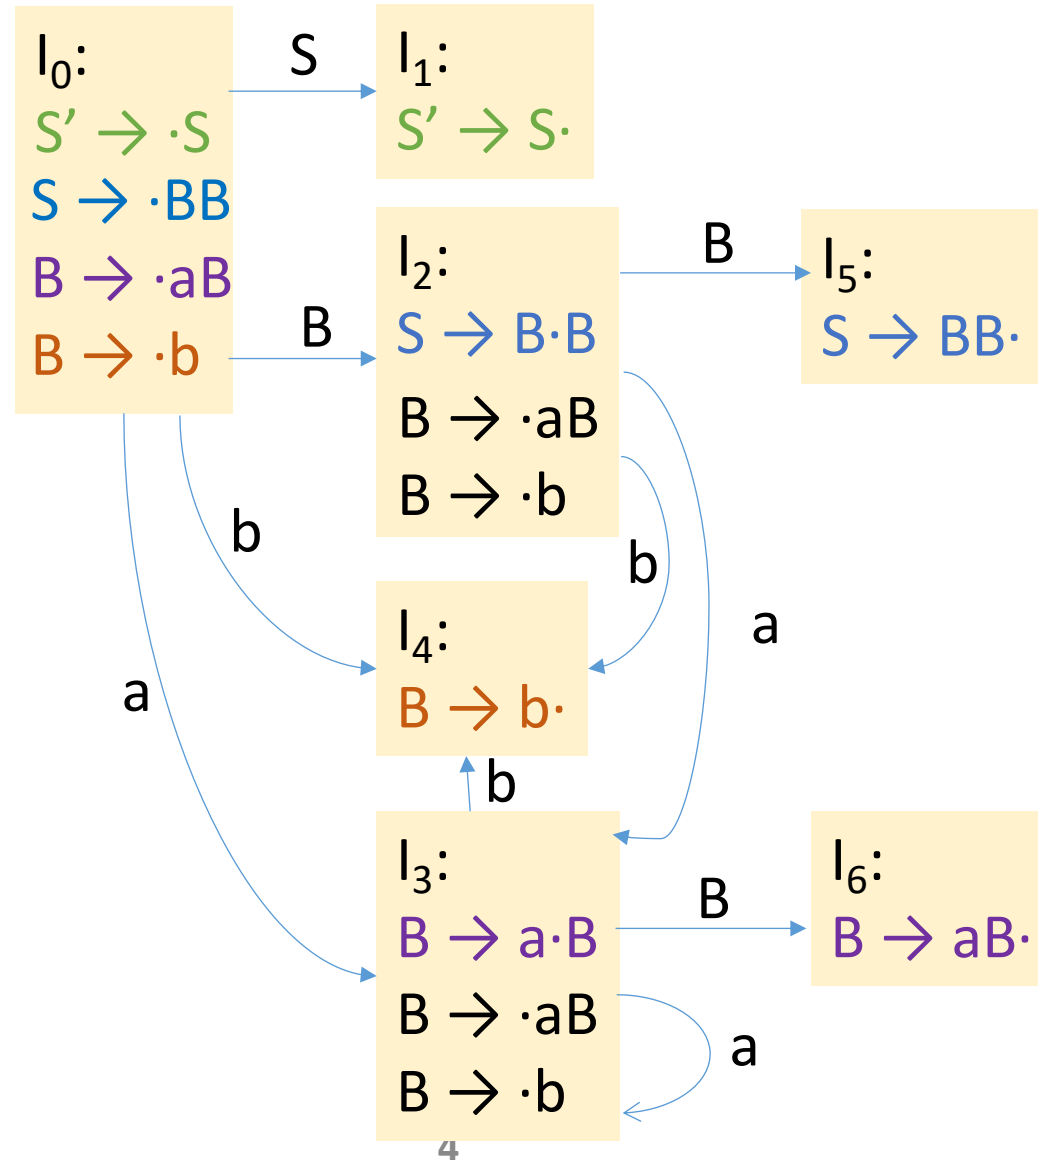

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

Example (cont.)

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

State	ACTION			GOTO	
	a	b	\$	S	B
0	s3	s4		1	2
1			acc		
2	s3	s4			5
3	s3	s4			6
4	r3	r3	r3		
5	r1	r1	r1		
6	r2	r2	r2		

“state j ” refers to the state corresponding to the set of items I_j

Example (cont.)

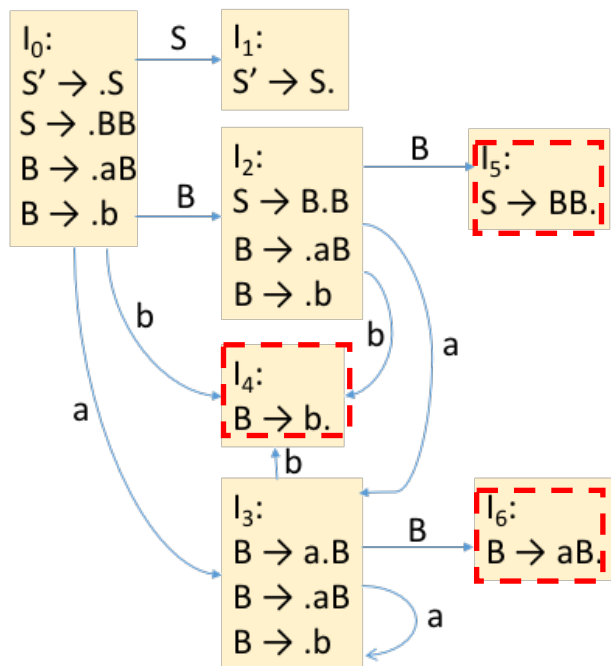

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

State	ACTION			GOTO	
	a	b	\$	S	B
0	s3	s4		1	2
1			acc		
2	s3	s4			5
3	s3	s4			6
4	r3	r3	r3		
5	r1	r1	r1		
6	r2	r2	r2		

“state j ” refers to the state corresponding to the set of items I_j

Example (cont.)

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

State	ACTION			GOTO	
	a	b	\$	S	B
0	s3	s4		1	2
1			acc		
2	s3	s4			5
3	s3	s4			6
4	r3	r3	r3		
5	r1	r1	r1		
6	r2	r2	r2		

“state j ” refers to the state corresponding to the set of items I_j

Example (cont.)

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

State	ACTION			GOTO	
	a	b	\$	S	B
0	s3	s4		1	2
1			acc		
2	s3	s4			5
3	s3	s4			6
4	r3	r3	r3		
5	r1	r1	r1		
6	r2	r2	r2		

“state j ” refers to the state corresponding to the set of items I_j

Example (cont.)

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

State	ACTION			GOTO	
	a	b	\$	S	B
0	s3	s4		1	2
1			acc		
2	s3	s4			5
3	s3	s4			6
4	r3	r3	r3		
5	r1	r1	r1		
6	r2	r2	r2		

“state j ” refers to the state corresponding to the set of items I_j

Example (cont.)

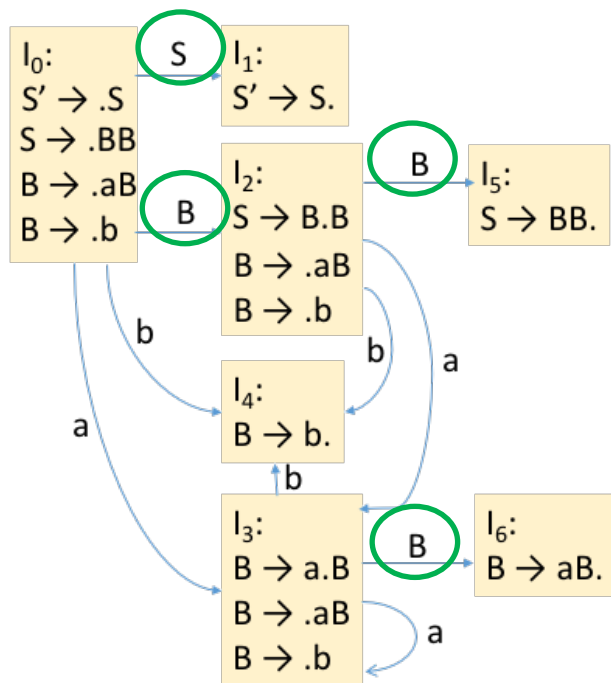

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

State	ACTION			GOTO	
	a	b	\$	S	B
0	s3	s4		1	2
1			acc		
2	s3	s4			5
3	s3	s4			6
4	r3	r3	r3		
5	r1	r1	r1		
6	r2	r2	r2		

“state j ” refers to the state corresponding to the set of items I_j

Example (cont.)

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

State	ACTION			GOTO	
	a	b	\$	S	B
0	s3	s4		1	2
1			acc		
2	s3	s4			5
3	s3	s4			6
4	r3	r3	r3		
5	r1	r1	r1		
6	r2	r2	r2		

“state j ” refers to the state corresponding to the set of items I_j

CLOSURE()[闭包]

- **Closure of item sets:** if I is a set of items for a grammar G , then $\text{closure}(I)$ is the set of items constructed from I by the two rules:
 - Initially, add every item in I to $\text{CLOSURE}(I)$
 - If $A \rightarrow \alpha \cdot B \beta$ is in $\text{CLOSURE}(I)$ and $B \rightarrow \gamma$ is a production, then add item $B \rightarrow \cdot \gamma$ to $\text{CLOSURE}(I)$, if it is not already there[期待B]
 - Apply this rule until no more new items can be added to $\text{CLOSURE}(I)$

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

$S' \rightarrow \cdot S$

$S' \rightarrow \cdot S$

$S \rightarrow \cdot BB$

$B \rightarrow \cdot aB$

$B \rightarrow \cdot b$

goto()[跳转]

- $\text{goto}(I, X)$: returns state (i.e., set of items) that can be reached by advancing X
 - Where I is a set of items and X is a grammar symbol
 - The closure of the set of all items $[A \rightarrow \alpha X \cdot \beta]$ such that $[A \rightarrow \alpha \cdot X \beta]$ is in I [即：识别了/归约到 X 后的item再闭包]
 - Used to define the transitions in the LR(0) automaton [定义了状态间的转换]
 - The states of the automaton correspond to sets of items, and $\text{goto}(I, X)$ specifies the transition from the state for I under input X

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

I_0 :

$S' \rightarrow \cdot S$

$S \rightarrow \cdot BB$

$B \rightarrow \cdot aB$

$B \rightarrow \cdot b$

goto()[跳转]

- $\text{goto}(I, X)$: returns state (i.e., set of items) that can be reached by advancing X
 - Where I is a set of items and X is a grammar symbol
 - The closure of the set of all items $[A \rightarrow \alpha X \cdot \beta]$ such that $[A \rightarrow \alpha \cdot X \beta]$ is in I [即：识别了/归约到 X 后的item再闭包]
 - Used to define the transitions in the LR(0) automaton [定义了状态间的转换]
 - The states of the automaton correspond to sets of items, and $\text{goto}(I, X)$ specifies the transition from the state for I under input X

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

I_0 :

$S' \rightarrow \cdot S$

$S \rightarrow \cdot BB$

$B \rightarrow \cdot aB$

$B \rightarrow \cdot b$

goto()[跳转]

- $\text{goto}(I, X)$: returns state (i.e., set of items) that can be reached by advancing X
 - Where I is a set of items and X is a grammar symbol
 - The closure of the set of all items $[A \rightarrow \alpha X \cdot \beta]$ such that $[A \rightarrow \alpha \cdot X \beta]$ is in I [即：识别了/归约到 X 后的item再闭包]
 - Used to define the transitions in the LR(0) automaton [定义了状态间的转换]
 - The states of the automaton correspond to sets of items, and $\text{goto}(I, X)$ specifies the transition from the state for I under input X

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

I_0 :

$S' \rightarrow \cdot S$

$S \rightarrow \cdot BB$

$B \rightarrow \cdot aB$

$B \rightarrow \cdot b$

goto()[跳转]

- $\text{goto}(I, X)$: returns state (i.e., set of items) that can be reached by advancing X
 - Where I is a set of items and X is a grammar symbol
 - The closure of the set of all items $[A \rightarrow \alpha X \cdot \beta]$ such that $[A \rightarrow \alpha \cdot X \beta]$ is in I [即：识别了/归约到 X 后的item再闭包]
 - Used to define the transitions in the LR(0) automaton [定义了状态间的转换]
 - The states of the automaton correspond to sets of items, and $\text{goto}(I, X)$ specifies the transition from the state for I under input X

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

I_0 :

$S' \rightarrow \cdot S$

$S \rightarrow \cdot BB$

$B \rightarrow \cdot aB$

$B \rightarrow \cdot b$

B

I_2 :

$S \rightarrow B \cdot B$

goto()[跳转]

- $\text{goto}(I, X)$: returns state (i.e., set of items) that can be reached by advancing X
 - Where I is a set of items and X is a grammar symbol
 - The closure of the set of all items $[A \rightarrow \alpha X \cdot \beta]$ such that $[A \rightarrow \alpha \cdot X \beta]$ is in I [即：识别了/归约到 X 后的item再闭包]
 - Used to define the transitions in the LR(0) automaton [定义了状态间的转换]
 - The states of the automaton correspond to sets of items, and $\text{goto}(I, X)$ specifies the transition from the state for I under input X

Grammar:

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

I_0 :

$S' \rightarrow \cdot S$

$S \rightarrow \cdot BB$

$B \rightarrow \cdot aB$

$B \rightarrow \cdot b$

B

I_2 :

$S \rightarrow B \cdot B$

$B \rightarrow \cdot aB$

$B \rightarrow \cdot b$

Construct LR(0) States

- [增广文法] Create augmented grammar G' for G
 - Given $G: S \rightarrow \alpha \mid \beta$, create $G': S' \rightarrow S \mid S \rightarrow \alpha \mid \beta$
 - Creates a single rule $S' \rightarrow S$ that when reduced, signals acceptance
- [初始状态] Create 1st state by performing a closure on initial item $S' \rightarrow \cdot S$
 - **Closure(I)**: creates state from an initial set of items I
 - $\text{Closure}(\{S' \rightarrow \cdot S\}) = \{S' \rightarrow \cdot S, S \rightarrow \cdot \alpha, S \rightarrow \cdot \beta\}$
- [添加状态] Create additional states by performing a **goto** on each symbol
 - **Goto(I, X)**: creates state that can be reached from I by advancing X
 - If α was single symbol, the following new state would be created:
 $\text{Goto}(\{S' \rightarrow \cdot S, S \rightarrow \cdot \alpha, S \rightarrow \cdot \beta\}, \alpha) =$
 $\text{Closure}(\{S \rightarrow \alpha \cdot\}) = \{S \rightarrow \alpha \cdot\}$
- [重复操作] Repeatedly perform gotos until there are no more states to add

Construct DFA

- Compute canonical LR(0) collection[规范LR(0)项集族, C], i.e., set of all states in DFA
 - One collection of sets of LR(0) items provides the basis for constructing a DFA that is used to make parsing decisions
 - Such an automaton is called an **LR(0) automaton**[LR(0)自动机]
 - Each state of the LR(0) automaton represents a set of items in the C
- All new states are added through goto(I, X)
 - State transitions are done on symbol X

```
void items(G') { // G': the augmented grammar
  C = { CLOSURE({[S' → ·S]}) }; // C: the canonical collection of sets of LR(0) items
  repeat
    for ( each state I in C )
      for ( each grammar symbol X )
        if ( goto(I, X) is not empty and not in C )
          add goto(I, X) to C;
  until no new states are added to C
```

LR(0) Automaton[自动机]

- The LR(0) automaton: each time we perform a shift we are following a transition to a new state[移入：到新状态]
 - States: the sets of items in C
 - Start state: $CLOSURE(\{[S' \rightarrow \cdot S]\})$
 - State j refers to the state corresponding to the set of items I_j
 - Transitions are given by the goto() function
- How can the automaton help with shift-reduce decisions?
 - Suppose that the string γ of grammar symbols takes the LR(0) automaton from the start state 0 to some state j
 - Then, shift on next input symbol a if state j has a transition on a
 - Otherwise, we choose to reduce
 - The items in state j tell us which production to use (e.g., $E \rightarrow \alpha$)
 - $E \rightarrow \alpha$: pop states for α , bringing state x to the top and look for a transition on E to state y (i.e., state x has a transition on E to state y), which is then pushed to stack

The Example

Grammar:

$$(0) S' \rightarrow S$$

$$(1) S \rightarrow BB$$

$$(2) B \rightarrow aB$$

$$(3) B \rightarrow b$$

- $S_0 = \text{Closure}(\{S' \rightarrow .S\})$
 $= \{S' \rightarrow .S, S \rightarrow .BB, B \rightarrow .aB, B \rightarrow .b\}$
- $\text{Goto}(S_0, B) = \text{closure}(\{S \rightarrow B.B\})$
 $S_2 = \{S \rightarrow B.B, B \rightarrow .aB, B \rightarrow .b\}$
- $\text{Goto}(S_0, a) = \text{closure}(\{B \rightarrow a.B\})$
 $S_3 = \{B \rightarrow a.B, B \rightarrow .aB, B \rightarrow .b\}$
- $\text{Goto}(S_0, b) = \text{closure}(\{B \rightarrow b.\})$
 $S_4 = \{B \rightarrow b.\}$

... ..

The Example

Grammar:

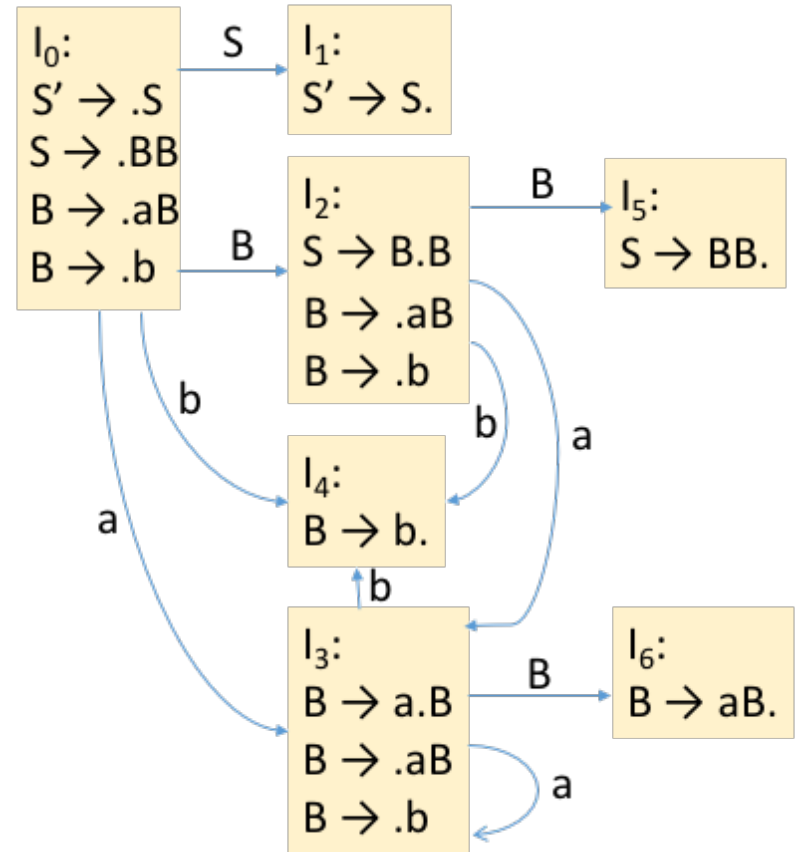

(0) $S' \rightarrow S$

(1) $S \rightarrow BB$

(2) $B \rightarrow aB$

(3) $B \rightarrow b$

- $S_0 = \text{Closure}(\{S' \rightarrow .S\})$
 $= \{S' \rightarrow .S, S \rightarrow .BB, B \rightarrow .aB, B \rightarrow .b\}$
- $\text{Goto}(S_0, B) = \text{closure}(\{S \rightarrow B.B\})$
 $S_2 = \{S \rightarrow B.B, B \rightarrow .aB, B \rightarrow .b\}$
- $\text{Goto}(S_0, a) = \text{closure}(\{B \rightarrow a.B\})$
 $S_3 = \{B \rightarrow a.B, B \rightarrow .aB, B \rightarrow .b\}$
- $\text{Goto}(S_0, b) = \text{closure}(\{B \rightarrow b.\})$
 $S_4 = \{B \rightarrow b.\}$

Build Parse Table from DFA

- ACTION: [*state*, *terminal symbol*]
- GOTO: [*state*, *non-terminal symbol*]
- ACTION[动作]
 - If $[A \rightarrow \alpha \cdot a \beta]$ is in S_i and $\text{goto}(S_i, a) = S_j$, where “a” is a terminal, then $\text{ACTION}[S_i, a] = \text{shift } j$ (*sj*)
 - If $[A \rightarrow \alpha \cdot]$ is in S_i and $A \rightarrow \alpha$ is rule numbered j , then $\text{ACTION}[S_i, a] = \text{reduce } j$ (*rj*)
 - If $[S' \rightarrow S \cdot]$ is in S_i then $\text{ACTION}[S_i, \$] = \text{accept}$
 - If no conflicts among ‘shift’ and ‘reduce’ (the first two ‘if’s), then this parser is able to parse the given grammar
- GOTO[跳转]
 - if $\text{goto}(S_i, A) = S_j$ then $\text{GOTO}[S_i, A] = j$
- All entries not filled are rejects

State	ACTION			GOTO

4	r3	r3	r3		
5	r1	r1	r1		
6	r2	r2	r2		

☆ 是LR(0)，没有任何lookahead ☆

- state直接决定了是shift/reduce，并不需要看输入符号
- 若reduce，输入符号及整个input buffer没有任何变化
- 若shift，输入符号从input buffer移入stack

LR(0) Parsing

- Construct LR(0) automaton from the Grammar [由文法构建自动机]
- Idea: assume
 - Input buffer contains α [但buffer不止有 α]
 - Next input is t [α 后是 t]
 - DFA on input α terminates in state s
 - α 处理完毕后处于状态 s
- Next: **reduce** by $X \rightarrow \beta$ if [归约]
 - s contains item $X \rightarrow \beta \cdot$
- Or, **shift** if [移进]
 - s contains item $X \rightarrow \beta \cdot tw$
 - Equivalent to saying s has a transition labeled t
