# Review Questions

- Is it possible to perform semantic analysis during parsing?

Yes. Syntax-directed translation, only one-pass.

- How to augment CFG to enable syntax directed?

Symbol: attributes, production: semantic rule.

- SDD vs. SDT?

SDD: syntax directed definition; SDT: translation scheme.

- Categories of semantic attributes?

Synthesized (child, itself), inherited (parent, sibling, itself).

- Suppose  $X.x = A.a + Y.y$ ,  $x$  is synthesized or inherited?

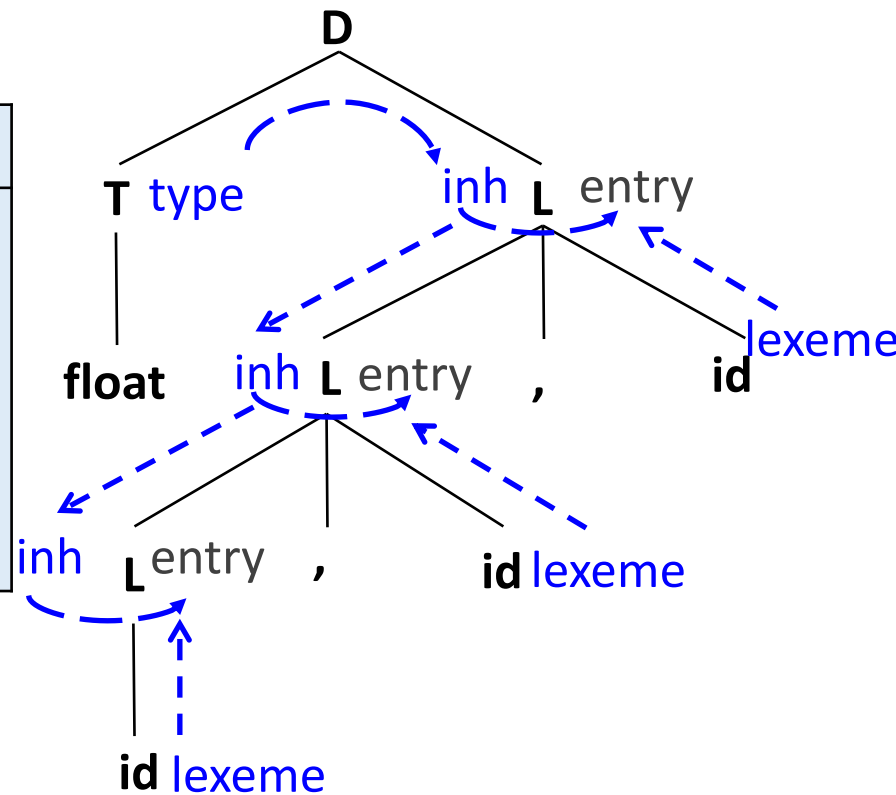

Inherited (parent, sibling).

A -> X Y Z

# Example: Dependency Graph

SDD:

Production Rules	Semantic Rules
(1) $D \rightarrow T L$	$L.inh = T.type$
(2) $T \rightarrow int$	$T.type = int$
(3) $T \rightarrow float$	$T.type = float$
(4) $L \rightarrow L_1, id$	$L_1.inh = L.inh$ $addtype(id.entry, L.inh)$
(5) $L \rightarrow id$	$addtype(id.entry, L.inh)$

Input:

float a, b, c

'entry' is dummy attribute for the *addtype()*

# Evaluation Order[属性值计算顺序]

---

- Ordering the evaluation of attributes[计算顺序]
  - Dependency graph characterizes possible orders in which we can evaluate the attributes at the various nodes of a parse-tree
- If the graph has an edge from node  $M$  to node  $N$ , then the attribute associated with  $M$  must be evaluated before  $N$ [用图的边来确定计算顺序]
  - Thus, the only allowable orders of evaluation are those sequences of nodes  $N_1, N_2, \dots, N_k$  such that if there is an edge of the graph from  $N_i$  to  $N_j$ , then  $i < j$
  - Such an ordering embeds a directed graph into a linear order, and is called a **topological sort**[拓扑排序] of the graph
    - If there's any cycle in the graph, then there are no topological sorts, i.e., no way to evaluate the SDD on this parse tree
    - If there are no cycles, then there is always at least one topological sort

# Example: Evaluation Order

SDD:

Production Rules	Semantic Rules
(1) $D \rightarrow T L$	$L.inh = T.type$
(2) $T \rightarrow int$	$T.type = int$
(3) $T \rightarrow float$	$T.type = float$
(4) $L \rightarrow L_1, id$	$L_1.inh = L.inh$ $addtype(id.lexeme, L.inh)$
(5) $L \rightarrow id$	$addtype(id.lexeme, L.inh)$

Input:

float a, b, c

Topological sort:  
1, 2, 3, 4,
5, 6, 7,
8, 9,
 10

# Evaluation Order (cont.)

- Before evaluating an attribute at a node of a parse tree, we must evaluate all attributes it depends on[依赖关系]
  - Synthesized: evaluate children first, then the node itself[依赖关系简单]
    - Any bottom-up order is fine
  - For SDD's with both inherited and synthesized attributes, there's no guarantee that there is even one evaluation order[依赖关系复杂]
- Difficult to determine whether exist any circularities[非常难确定是否有循环依赖]
  - But, there are useful subclasses of SDD's that are sufficient to guarantee that an evaluation order exists[一些SDD确保无循环]
    - Such classes do not permit graphs with cycles

Production

$A \rightarrow B$

Semantic Rules

$A.s = B.i;$

$B.i = A.s + 1;$

# S-Attributed Definitions[s-属性定义]

- An SDD is **S-attributed** if every attribute is synthesized[只具有综合属性]
- If an SDD is S-attributed (S-SDD)
  - We can evaluate its attributes in any bottom-up order of the nodes of the parse-tree[任何自底向上的顺序计算属性值]
  - Can be implemented during bottom-up parsing[LR分析中实现]

Production Rules	Semantic Rules
(1) $L \rightarrow E$	$\text{print}(E.val)$
(2) $E \rightarrow E_1 + T$	$E.val = E_1.val + T.val$
(3) $E \rightarrow T$	$E.val = T.val$
(4) $T \rightarrow T_1 * F$	$T.val = T_1.val \times F.val$
(5) $T \rightarrow F$	$T.val = F.val$
(6) $F \rightarrow (E)$	$F.val = E.val$
(7) $F \rightarrow \text{digit}$	$F.val = \text{digit.lexval}$

# L-Attributed Definitions [L-属性定义]

- An SDD is **L-attributed** (L-SDD) if
  - Between the attributes associated with a production body, dependency-graph edges can go from left to right, but not from right to left [依赖图的边只能从左到右 (无循环、处理顺序)]
  - More precisely: each attribute must be either **synthesized**, or **inherited** but with the rules limited as follows: suppose  $A \rightarrow X_1 X_2 \dots X_n$ , the inherited attribute  $X_i.a$  only depends on
    - **Inherited** attributes associated with A Why not synthesized?
    - Either **syn or inh** attributes of  $X_1, X_2, \dots, X_{i-1}$  located to the **left** of  $X_i$  Cycle:  $X_i$  depends on A, A.s depends on  $X_i$
    - Either **syn or inh** attributes of  $X_i$  itself, but **no cycles** formed by the attributes of this  $X_i$
- Can be implemented during top-down parsing [LL分析中]

Production Rules	Semantic Rules
A $\rightarrow$ B C	A.s = B.b B.i = f(C.c, A.s)
Not S-SDD: B.i is inh	Not L-SDD: A.s is syn attr Not L-SDD: C is right to B

S-SDD or L-SDD?

# SDD vs. SDT

- SDD[语法制导定义]: 是CFG的推广, 翻译的高层次规则说明
  - A CFG grammar together with attributes and semantic rules
    - A subset of them are also called **attribute grammars**[属性文法]
      - No side effects, i.e., rules are strictly local to each production
  - Semantic rules imply **no order** to attribute evaluation
- SDT[语法制导翻译方案]: SDD的补充, 具体翻译实施方案
  - An executable specification of the SDD
    - Fragments of progs are attached to different points in the production rules
  - The **order** of execution is important

Grammar

```
D -> T L
T -> int
T -> float
L -> L1, id
L -> id
```

SDD

```
L.inh = T.type
T.type = int
T.type = float
L1.inh = L.inh
id.type = L.inh
```

SDT

```
D -> T { L.inh = T.type } L
T -> int { T.type = int }
T -> float { T.type = float }
L -> { L1.inh = L.inh } L1, id
L -> { id.type = L.inh } id
```

# Syntax Directed Trans. Impl.[实现]

---

- Learnt how to specify translation: SDD and SDT[定义]
  - SDT is an executable specification of the SDD
    - CFG with semantic actions embedded in production bodies
- SDT can be implemented in two ways[具体实现]
  - Using a parse tree or AST[基于预先构建的分析树]
    - First build a parse tree, and then apply rules or actions at each node while traversing the tree
    - All SDDs (without cycles) and SDTs can be implemented
      - Since the tree can be traversed freely, implements any ordering
  - During parsing, without building a parse tree[语法分析过程中]
    - Apply rules or actions at each production while parsing
    - **Only a subset** of SDDs and SDTs can be implemented
      - Evaluation ordering restricted to parser derivation order[一定按parse顺序]

# Syntax Directed Trans. Impl. (cont.)

---

- Typically, SDD (i.e., semantic analysis) is implemented during parsing[更为高效]
  - Allows compiler to skip parse tree generation
  - Saves time and memory
- Two important classes of SDD's[两个关键子类]
  - SDD is S-attributed, the underlying grammar is LR-parsable
  - SDD is L-attributed, the underlying grammar is LL-parsable
  - For both classes, semantic rules in an SDD can be converted into an SDT with actions that are executed at the right time[允许SDD到SDT的转换]
    - During parsing, an action in a production body is executed as soon as all the grammar symbols to the left of the action have been matched

# == Implement S-SDD ==

- Convert S-attributed SDD to SDT by[S-SDD到SDT的转换]
  - Placing each action at the end of the production[将每个语义动作都放在产生式的最后]
  - SDTs with all actions at the right ends of the production bodies are called **postfix SDT's**[后綴/尾部SDT]

S-SDD

SDT

Production Rules	Semantic Rules
(1) $L \rightarrow E$	$\text{print}(E.val)$
(2) $E \rightarrow E_1 + T$	$E.val = E_1.val + T.val$
(3) $E \rightarrow T$	$E.val = T.val$
(4) $T \rightarrow T_1 * F$	$T.val = T_1.val \times F.val$
(5) $T \rightarrow F$	$T.val = F.val$
(6) $F \rightarrow (E)$	$F.val = E.val$
(7) $F \rightarrow \text{digit}$	$F.val = \text{digit.lexval}$

CFG with actions
(1) $L \rightarrow E \{ \text{print}(E.val) \}$
(2) $E \rightarrow E_1 + T \{ E.val = E_1.val + T.val \}$
(3) $E \rightarrow T \{ E.val = T.val \}$
(4) $T \rightarrow T_1 * F \{ T.val = T_1.val \times F.val \}$
(5) $T \rightarrow F \{ T.val = F.val \}$
(6) $F \rightarrow (E) \{ F.val = E.val \}$
(7) $F \rightarrow \text{digit} \{ F.val = \text{digit.lexval} \}$

# Implement S-SDD (cont.)

- If the underlying grammar of S-SDD is LR parsable
  - Then the SDT can be implemented during LR parsing
- Implement the converted SDT by [借助归约实现]
  - Executing the action along with the reduction of  $head \leftarrow body$

SDT

CFG with actions
(1) $L \rightarrow E$ { $print(E.val)$ }
(2) $E \rightarrow E_1 + T$ { $E.val = E_1.val + T.val$ }
(3) $E \rightarrow T$ { $E.val = T.val$ }
(4) $T \rightarrow T_1 * F$ { $T.val = T_1.val \times F.val$ }
(5) $T \rightarrow F$ { $T.val = F.val$ }
(6) $F \rightarrow (E)$ { $F.val = E.val$ }
(7) $F \rightarrow digit$ { $F.val = digit.lexval$ }

# == Implement L-SDD ==

- We have examined S-SDD  $\rightarrow$  SDT  $\rightarrow$  implementation 
  - S-SDD can be converted to SDT with actions at production end
  - The SDT can be parsed and translated bottom-up, as long as the underlying grammar is LR-parsable
- What about the more general **L-SDD**? [L-属性文法]
  - Rules for turning L-SDD into an SDT
    - Embed the semantic rule that computes the **inherited attributes** for a nonterminal **A** **immediately before that occurrence of A** in the production body **综合属性呢 ??? 综合属性在A $\rightarrow$ xxx那个产生式处理!**  
[将计算某个非终结符A的继承属性的语义规则插入到产生式右部中紧靠在A的本次出现之前的位置上] **能延后放吗? A后的其他符号很可能依赖于A的属性!**
    - Place the rules that compute a **synthesized attribute** for the head of a production at **the end of the body** of that production  
[将计算一个产生式左部符号的综合属性的规则放在这个产生式右部的末尾]

# Example

$A \rightarrow B.C$

- C的继承属性: 出现之前
- A的综合属性: 产生式末尾

Production Rules	Semantic Rules
(1) $T \rightarrow F T'$	$T'.inh = F.val$ $T.val = T'.syn$
(2) $T' \rightarrow * F T_1'$	$T_1'.inh = T'.inh \times F.val$ $T'.syn = T_1'.syn$
(3) $T' \rightarrow \epsilon$	$T'.syn = T'.inh$
(4) $F \rightarrow digit$	$F.val = digit.lexval$

# Example

$A \rightarrow B.C$

- C的继承属性: 出现之前
- A的综合属性: 产生式末尾

Production Rules	Semantic Rules
(1) $T \rightarrow F T'$	$T'.inh = F.val$ $T.val = T'.syn$
(2) $T' \rightarrow * F T_1'$	$T_1'.inh = T'.inh \times F.val$ $T'.syn = T_1'.syn$
(3) $T' \rightarrow \epsilon$	$T'.syn = T'.inh$
(4) $F \rightarrow digit$	$F.val = digit.lexval$

## SDT

- (1)  $T \rightarrow F \{ T'.inh = F.val \} T' \{ T.val = T'.syn \}$
- (2)  $T' \rightarrow * F \{ T_1'.inh = T'.inh \times F.val \} T_1' \{ T'.syn = T_1'.syn \}$
- (3)  $T' \rightarrow \epsilon \{ T'.syn = T'.inh \}$
- (4)  $F \rightarrow digit \{ F.val = digit.lexval \}$

# Implement the SDT of L-SDD

---

- If the underlying grammar is LL-parsable, then the SDT can be implemented during LL or LR parsing[若文法是LL可解析的，则可在LL或LR语法分析过程中实现]
- Semantic translation during **LL parsing**, using[LL方式]
  - A recursive-descent parser[LL递归下降]
    - Augment non-terminal functions to both parse and handle attributes
  - A predictive parser[LL非递归的预测分析]
    - Extend the parse stack to hold actions and certain data items needed for attribute evaluation
- A LR parser[LR方式]
  - Involve marker to rewrite grammars

# L-SDD in LL Parsing[非递归预测]

- Extend the parse stack to hold **records** and certain **data items** needed for attribute evaluation[扩展语法分析栈]
  - **Action-record**[动作记录]: represent the actions to be executed
  - **Synthesize-record**[综合记录]: hold synthesized attrs for non-terminals
  - Typically, the **data items** are copies of attributes[属性备份]
- Manage attributes on the stack[管理属性信息]
  - The **inherited** attributes of a nonterminal  $A$  are placed in the stack record that represents that terminal[符号位放继承属性]
    - Action-record to evaluate these attributes are immediately above  $A$
  - The **synthesized** attributes of a nonterminal  $A$  are placed in a separate synthesize-record that is immediately below  $A$ [综合属性另存放]

action	Code
A	Inh Attr.
A.syn	Syn Attr.

# L-SDD in LL Parsing (cont.)

---

- Table-driven LL-parser
  - Mimics a leftmost derivation --> stack expansion
- $A \rightarrow BC$ , suppose nonterminal  $C$  has an inherited attr  $C.i$ 
  - $C.i$  may depend not only on the inherited attr. of  $A$ , but on all the attrs of  $B$ [依赖于左侧]
    - Extra care should be taken on the attribute values
  - Since SDD is L-attributed, surely that the values of the inherited attrs of  $A$  are available when  $A$  rises to stack top ( $X \rightarrow \alpha A \beta$ )[左侧就绪]
    - Thus, available to be copied into  $C$
  - $A$ 's synthesized attrs remain on the stack, below  $B$  and  $C$  when expansion happens[综合属性也还在栈里]

action	Code
A	Inh Attr.
A.syn	Syn Attr.

# L-SDD in LL Parsing (cont.)

- $A \rightarrow BC$ :  $C.i$  may depend not only on the inherited attr. of  $A$ , but on all the attrs of  $B$ 
  - Thus, need to process  $B$  completely before  $C.i$  can be evaluated
  - Save **temporary copies** of all attrs needed by evaluate  $C.i$  in the **action-record** that evaluates  $C.i$ ; otherwise, when the parser replaces  $A$  on top of the stack by  $BC$ , the inherited attrs of  $A$  will be gone, along with its stack record
  - 变量展开时 (i.e., 变量本身的记录出栈时)，若其含有继承属性，则要将继承属性复制给后面的动作记录
  - 综合记录出栈时，要将综合属性值复制给后面的动作记录

action	Code
A	Inh Attr.
A.syn	Syn Attr.

# Example

(1)  $T \rightarrow F \{ T'.inh = F.val \} T' \{ T.val = T'.syn \}$

(2)  $T' \rightarrow * F \{ T_1'.inh = T'.inh \times F.val \} T_1' \{ T'.syn = T_1'.syn \}$

(3)  $T' \rightarrow \epsilon \{ T'.syn = T'.inh \}$

(4)  $F \rightarrow \text{digit} \{ F.val = \text{digit.lexval} \}$

Three kinds of symbols:

- 1) terminal
- 2) non-terminal
- 3) action

(1)  $T \rightarrow F \{ a_1 \} T' \{ a_2 \}$

$a_1: T'.inh = F.val$

$a_2: T.val = T'.syn$

(2)  $T' \rightarrow * F \{ a_3 \} T_1' \{ a_4 \}$

$a_3: T_1'.inh = T'.inh \times F.val$

$a_4: T'.syn = T_1'.syn$

(3)  $T' \rightarrow \epsilon \{ a_5 \}$

$a_5: T'.syn = T'.inh$

(4)  $F \rightarrow \text{digit} \{ a_6 \}$

$a_6: F.val = \text{digit.lexval}$
